ABSTRACT

This study aims to determine the effect of the use of information technology on employee performance, which is mediated by user satisfaction and the suitability of technology tasks. Respondents in this study were employees of PT Kimia Farma Pharmacy Yogyakarta Business Unit. The sample used was 110 respondents, with a quantitative method using SEM and AMOS. From the data that has been tested and collected, the results of this study indicate that the use of information technology has a significant positive effect on employee performance and task-technology fit. User satisfaction and task-technology fit do not mediate the positive and insignificant effects of using information technology on employee performance. User satisfaction has no positive effect on performance and is insignificant. Task-technology fit has a positive effect on performance.

Introduction

An integrated information system via the internet can have a positive impact, namely saving time, increasing speed, and improving accuracy in disseminating information so that it can support work productivity (Lou et al., 2021). According to Jogiyanto (2017), in applying work, it is necessary to use information technology; this is a form of behavior carried out by employees with technology. Actual use is actual behavior in adopting a system.

The purpose of actual use is to describe and predict how users perceive new information technology in order to evaluate the application of that technology. Isaac et al. (2017a) show in their research that every level of satisfaction will have a stronger positive impact on users' Task Technology Fit (TTF) and also on their performance. The performance of each individual will be affected by satisfaction. User satisfaction and the performance of each individual become more positive and stronger because they are influenced by Task Technology Fit (TTF). Finally, there are two mediators, namely user satisfaction and task technology fit (TTF), in the relationship between usage and performance.

Task Technology Fit (TTF) was developed by Goodhue and Thompson (1995) to help people do their tasks according to the technology used, which is a defined level of task technology fit (TTF). Specifically, "task technology fit" (TTF) is the compatibility experienced by each individual in carrying out their duties and the abilities each individual gains in carrying out the functions of an information technology. According to DeLone and McLean (20013) the effectiveness of an information technology is often used to measure the satisfaction of its users. A system can be said to be effective if the system can provide the best results for the company, then a system must have several impacts on its use such as being able to increase work productivity and with such a system an individual can make the right decisions.

This study aims to determine the effect of the use of information technology on employee performance, which is mediated by user satisfaction and the suitability of technology tasks

Literature Review

Conceptual Background

Performance

Employee performance is very important for any company as it ultimately leads to the success of the company. Performance is defined as the way in which workers carry out organizational tasks, also linking worker behavior with the company's own norms (Bashir, et al., 2020).

According to Fogaça et al. (2018), performance can be defined as all behaviors that employees carry out while working. Individual job performance is a relevant outcome measure from studies in work settings; refers to how well a person performs in his job. According to Bendassolli (2012), performance refers to actions that individuals love to produce actions that are guided by results, with conscious goals or prior motivation.

Use of Technology

According to Jogiyanto (2017) the use of information technology is the behavior of employees in utilizing technology to carry out their duties, the measurement is based on the frequency of use in the diversity of applications used.

According to Islami, Asdar, and Baumassepe (2021), actual use of technology is the actual behavior of employees in adopting a technology when carrying out their work. So it can be concluded that actual use is a form of external psychomotor response of an employee. According to Siti Taufik Muntianah, et al. (2012), actual use is measured as the amount of time spent interacting with a technology and the frequency of its use.

User Satisfaction

User satisfaction is a feeling that is obtained after using a system. There needs to be an influence to increase satisfaction, such as service quality, adequate systems, and information. To see the level of user satisfaction, it is necessary to have a meter where each individual can see the satisfaction of each individual from the performance results that are supported by the service provider system (Petter, Delone, and Mclean 2008).

According to Kotler (2015), feeling happy after getting something that is in accordance with the performance or results of a product and the feeling of having got something expected is the nature of satisfaction.

Task-Technology Fit

Task Technology Fit (TTF) was developed by Goodhue and Thompson which is defined as the degree to which technology assists individuals in carrying out their duties or job duties (Spies et al., 2020).

There is a relationship that occurs between TTF and its users towards trust in a system. This is the influence of TTF on users who can take advantage of technology. A system can be said to be useful and can provide an advantage if the user can make good use of it because TTF is very important. An achievement of each individual's task is a context in the performance influence relationship. In an effectiveness and quality there needs to be an increase therefore improvements in performance need to be done this is the implication of a performance (Goodhue and Thompson, 1995).

The influence of technology utilization and performance is obtained from compatibility support between tasks and technology which is a conclusion from TTF theory. It can be said that TTF is the need of each individual in carrying out and completing each task and it can be interpreted that the individual can accept technological developments. TTF has 5 (five) main constructs namely: task characteristics, technology characteristics, task-technology fit, performance impact and utilization which were developed from 8 (eight) components namely: data quality, efficient location of data, authorization to access data, data compatibility, training and ease of use, production timeliness, systems reliability, and information system relationship with users (Kurniabudi and Assegaff, 2018)

Empirical Review and Hypothesis Development

Effect of the use of information technology on user satisfaction

The actual use of the system is as a form of external psychomotor response as measured by a person through real use (Islami, Asdar, and Baumassepe, 2021). There are studies showing that the use of information technology significantly affects user satisfaction in the context of internet technology in Malaysia (Norzaidi and Salwani, 2009), and other studies have found that the use of information technology predicts user satisfaction (Chung-Kuang Hou, 2012; Khayun and Ractham, 2011; Isaac et al., 2017a, Isaac et al., 2017b; Sundaram et al.; 2007 . Therefore, the following hypothesis is proposed:

H1: The use of information technology at Kimia Farma Pharmacy Employees has an effect on User Satisfaction

Effect of the use of information technology on task-technology fit

According to Jogiyanto & Abdillah (2011), To get information technology that suits the organization, it needs a large investment so that it can help the company achieve its goals. The use of technology must be maximized by the investment made by the company. Information technology must also be treated professionally so that it can be used as fully as possible. The existence of a positive relationship between the use of information technology and TTF is supported by several studies. (D'Ambra et al., 2013; D'Ambra dan Wilson, 2011; Norzaidi dan Salwani, 2009; Isaac et a., 2017a; Awad, 2020). Therefore, the following hypothesis is proposed:

H2: The use of information technology by Kimia Farma Pharmacy Employees influences the Task-Technology Fit

Effect of the use of information technology on employee performance

According to Jogiyanto (2017), the use of information technology is the behavior of employees in utilizing technology to carry out their duties; the measurement is based on the frequency of use and the diversity of applications used.

The relationship between information technology use and performance is one of the most important directions for future research on the topic of technology use. Several studies emphasize that the use of information technology positively affects performance (Isaac et al., 2016; Makokha dan Ochieng, 2014; D'Ambra et al., 2013; Chung-Kuang Hou, 2012;D'Ambra dan Wilson, 2011), There have been other studies that have found the opposite, that usage doesn't actually impact performance (Cho et al., 2015; Khayun dan Ractham, 2011; Isaac et al., 2017a; Awad, 2020). Therefore, the following hypothesis is proposed:

H3: The use of information technology at Kimia Farma Pharmacy Employees has an effect on employee performance

Effect of user satisfaction on employee performance

The success of an application on a system can be measured by seeing how satisfied the use of information technology is by each individual by evaluating it (Montesdioca dan Maçada, 2014). In this study it can be defined that the use of the internet is satisfied with the decisions of those who have used it because in using the internet it can meet expectations so that if it is needed to work it will improve its performance (Wang dan Liao, 2008). Important studies have proven that user satisfaction affects performance impact (Makokha dan Ochieng, 2014; Norzaidi dan Salwani, 2009; Son et al., 2012; Wang dan Liao, 2008; Chung-Kuang Hou, 2012). Therefore, the following hypothesis is proposed:

H4: User satisfaction affects the performance of Kimia Farma Pharmacy employees

Effect of task-technology fit on the performance of Kimia Farma Pharmacy employees

Task-Technology Compatibility is considered to be very important as far as studying the use of technology in the organization is concerned (D'Ambra et al., 2013). Conformity between the tasks performed by employees and the technology or application system used will lead to increased performance. Several studies confirm the positive and significant effect of task-technology fit on employee performance (El Said, 2015; Isaac et al., 2017; Yi et al., 2016; Shahreki dan Nakanishi, 2016).

Several studies have been conducted to investigate the positive influence of the Task-Technology Fit construct on information system success factors such as performance impact and user satisfaction. (Glowalla dan Sunyaev, 2014; Lee dan Lehto, 2013; D'Ambra et al., 2013; D'Ambra dan Wilson, 2011), Therefore, the following hypothesis is proposed:

H5: Task-Technology Fit affects the performance of Kimia Farma Pharmacy employees

The Role Of Satisfaction Mediation On The Effect Of The Use Of Information Technology On The Performance Of Kimia Farma Pharmacy Employees

Internet technology has now become a fundamental work tool in several professions. Despite the wide diffusion and great relevance of the Internet, there is still limited knowledge about its impact on workers' welfare. In particular, use of the Internet for professional purposes is thought to influence job satisfaction (Castellacci, dan Viñas-Bardolet, 2018).

Several studies have explicitly shown that there is a relationship between Internet use at work and job satisfaction (Carlson, Carlson, Zivnuska, Harris, & Harris, 2017; Robertson & Kee, 2017).

While job satisfaction itself affects performance. Therefore, the following hypothesis is proposed:

H6: User satisfaction mediates the influence of the use of information technology on the performance of Kimia Farma Pharmacy employees.

The mediation role of task-technology fit on the influence of the use of information technology on the performance of Kimia Farma Pharmacy Employees

Task Technology Fit (TTF) was developed by Goodhue and Thompson and is defined as the degree to which technology assists individuals in carrying out their duties or job duties (Spies et al., 2020). Several researchers have examined the task-technology fit construct as a mediator variable. A study by Gatara and Cohen (2014) revealed that there is a mediating role of task-technology fit (suitability) between technology characteristics and performance. Gu and Wang (2009) found that technology-task fit significantly

mediated the relationship between individual quality and performance impact. This study contributes to the body of knowledge by investigating task-technology fit as a mediating variable in the relationship between actual use and performance impact (Isaac et al., 2017). Therefore, the following hypothesis is proposed:

H7: Task-Technology fit mediates the effect of the use of information technology on the performance of Kimia Farma Pharmacy employees

Based on previous research findings with various types of relationships and consequences, the following models of evaluation can be developed:

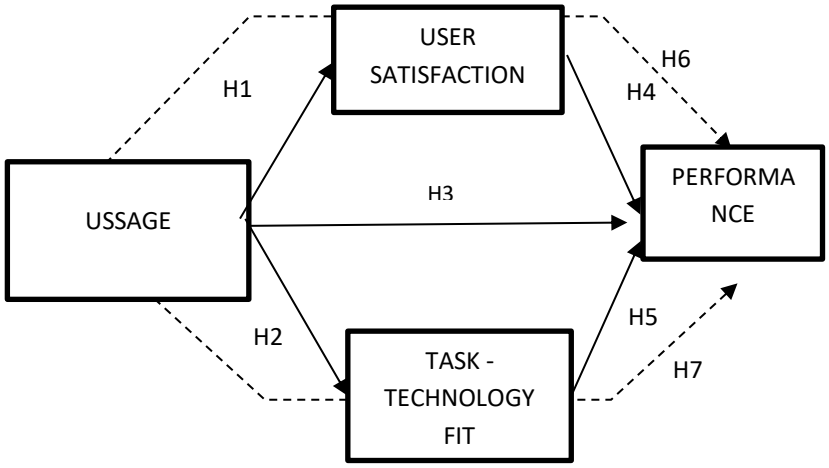

Figure 1: Research Model

Research and Methods

The sources of data used in this study are primary and secondary. And for this study, we used quantitative methods with a population of employees totaling 110 who work at PT Kimia Farma Apotek Yogyakarta Business Unit. In this study, we used a purposive sampling technique to collect data, a survey technique with a 1-5 scale questionnaire, and a literature review.

This study used validity and reliability tests. The validity test in this study was carried out using confirmatory factor analysis (CFA), where this study was tested in two ways, namely exogenous construct CFA and endogenous construct CFA. Furthermore, the reliability tests in this study included construct reliability (CR) and average variance extracted (AVE) tests. After the data is valid and reliable, do the structural equation modeling (SEM) test. Finally, do the hypothesis testing. The first hypothesis through the fifth hypothesis are tested by testing the significance of the parameters on the regression weight, while the sixth and seventh hypotheses are tested by comparing the standardized direct effect and standardized indirect effect to test the mediator variable.

Results

The following is the basic Structural Equation Model (SEM) model formed from the exogenous construct CFA model and the endogenous construct CFA given the regression line according to the model obtained from the theoretical study.

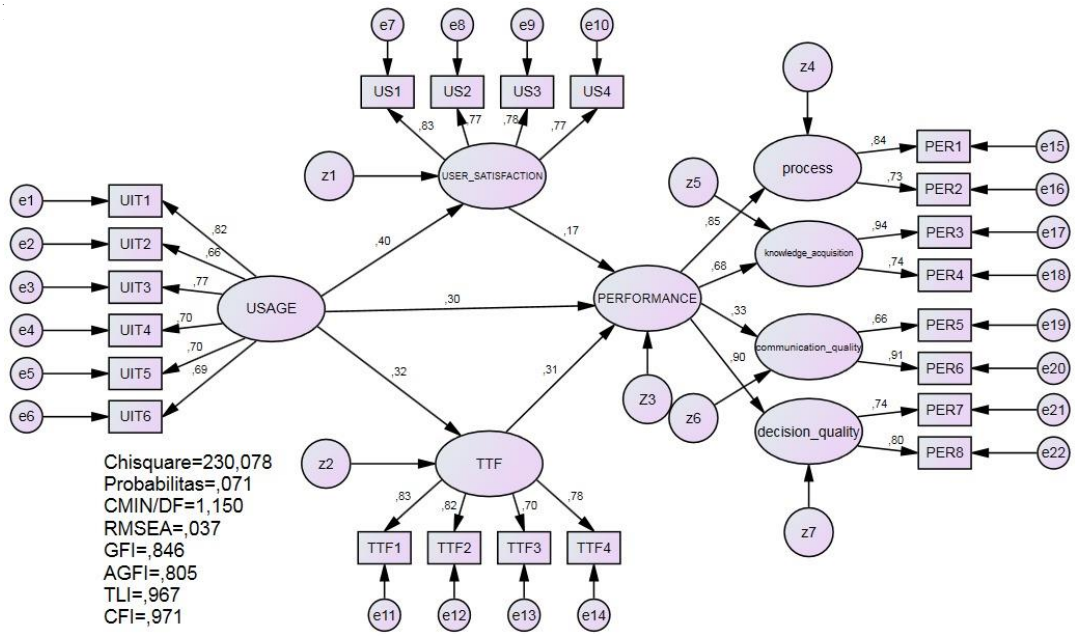

Figure 2: Structural Equation Model (SEM)

Results

Figure 2 shows that the chi-square value is 230.078 with a probability of 0.071, so it is concluded that the model is fit. This also applies to other goodness-of-fit indicators, namely CMIN/DF, RMSEA, TLI, and CFI. The GFI and AGFI value indicators are included in the moderate category. Based on the above-mentioned test results, it is concluded that the SEM model is a fit model.

Furthermore, based on Figure 2, the results of the SEM goodness-of-fit test can be described in the following table:

Table 1: Goodness of Fit SEM

Indicator Goodness-of-fit	**Recommendation Value**	**Model Results**	**Information**
Chi-Square	Expected small	230,078	
Significancy probability	≥ 0,05	0,071	Fit
CMIN/DF	≤ 2,00	1,150	Fit
RMSEA	≤ 0,08	0,037	Fit
GFI	≥ 0,90	0,846	Moderate
AGFI	≥ 0,90	0,805	Moderate
TLI	≥ 0,95	0,967	Fit
CFI	≥ 0,95	0,971	Fit

Source: Data Analysis, 2022

Testing the hypothesis in this study was carried out by SEM analysis. The first hypothesis to the fifth hypothesis is tested by testing the significance parameters on the regression weights. The results can be summarized in the following table:

Table 2: Regression Weight Influence between Variables

Ha	**Hypothesis**	**Estimate**	**S.E.**	**C.R.**	**p**	**description**
H_1	Usage → User Satisfaction	0,537	0,151	3,551	0,000	Accepted
H_2	Usage → Task-Technology Fit	0,402	0,140	2,868	0,004	Accepted
H_3	Usage → Performance	0,312	0,135	2,310	0,021	Accepted
H_4	User Satisfaction → Performance	0,133	0,091	1,462	0,144	Rejected
H_5	Task-Technology Fit → Performance	0,262	0,099	2,638	0,008	Accepted

Source: Data Analysis, 2022

The results of the tests carried out can be described as follows, for H1 the use of information technology by Kimia Farma employees has an effect on user satisfaction. The results of the SEM analysis obtained the value of C.R. of 3.551 and p of 0.000. Based on the p value <0.05, then H1 is accepted. H2 the use of information technology by Kimia Farma employees has an effect on task-technology

fit. The results of the SEM analysis obtained the value of C.R. of 2.868 and p of 0.004. Based on the p value <0.05, then H2 is accepted. H3 the use of Kimia Farma's employee information technology affects employee performance. The results of the SEM analysis obtained the value of C.R. of 2.310 and p of 0.021. Based on the p value <0.05, then H3 is accepted. H4 User satisfaction affects the performance of Kimia Farma employees. The results of the SEM analysis obtained the value of C.R. of 1.462 and p of 0.144. Based on the p value > 0.05, then H4 is rejected. H5 task-technology fit affects the performance of Kimia Farma employees in the Yogyakarta region. The results of the SEM analysis obtained the value of C.R. of 2.638 and p of 0.008. Based on the p value <0.05, then H5 is accepted.

Table 3: Standardized Direct Effect

	USAGE	TTF	USER_SATISFACTION	PERFORMANCE
TTF	,324	,000	,000	,000
User_satisfaction	,403	,000	,000	,000
Performance	,299	,311	,169	,000

Source: Data Analysis, 2022

Table 4: Standardized Indirect Effect

	USAGE	TTF	USER_SATISFACTION	PERFORMANCE
TTF	,000	,000	,000	,000
User_satisfaction	,000	,000	,000	,000
Performance	,169	,000	,000	,000

Source: Data Analysis, 2022

For H6 and H7, it is tested by comparing the values of the standardized direct effect and standardized indirect effect, where the direct effect of the use of information technology on performance is 0.299. For H6, user satisfaction mediates the effect of the use of information technology on the performance of Kimia Farma employees, where the direct effect of the use of information technology on user satisfaction is 0.403 and the direct effect of user satisfaction on performance is 0.169. Based on this, the indirect effect of the use of information technology on performance through user satisfaction is 0.403 x 0.169 = 0.068. This means that the direct effect is greater than the indirect effect (0.299 > 0.068), so it is concluded that H6 is rejected. H7 task-technology fit mediates the effect of the use of information technology on the performance of Kimia Farma employees, where the direct effect of the use of information technology on task-technology fit is 0.324 and the direct effect of task-technology fit on performance is 0.311. Based on this, the indirect effect of the use of information technology on performance through task-technology fit is 0.324 x 0.311 = 0.101. This means that the direct effect is greater than the indirect effect (0.299 > 0.101), so it is concluded that H7 is rejected.

Discussion

The results of research on H1 use of Kimia Farma employee information technology affect user satisfaction and support the research results of Isaac et al. (2017), Castellaccia and Bardolet (2018), and Atanda (2017). The use of information technology will make it easier for employees to complete the tasks that are their obligations. Employees are able to complete their tasks more quickly and accurately, so the quality of their work is also getting higher. The results of H2 research on the use of information technology by Kimia Farma employees affect task-technology fit and support the research results of Isaac et al. (2017), D'Ambra et al. (2013), and Awad (2020). The more often employees use information technology in communication and work completion, along with a higher duration of use, will increase the employee's ability to use information technology to complete work. The results of research on how H3 use of Kimia Farma employee information technology affects employee performance support the research results of Isaac et al. (2017), Cho et al. (2015), Awad (2020), and Sundaram et al. (2007). The use of information technology also allows employees to gain new knowledge and creative ideas for completing work; employees will also be able to identify problems and make decisions to solve them; and it also enables better communication between employees and clients. All of these things will have an impact on improving employee performance.

The results of the H4 study show that user satisfaction has no effect on the performance of Kimia Farma employees in the Yogyakarta region. The results of this study support the results of research by Adiyasa & Windayanti (2019) and Sutopo (2018). Satisfaction has no significant effect on performance because employees have not fully mastered the available information systems. The results of the H5 study indicate that task-technology fit affects the performance of Kimia Farma employees. The results of this study support the results of Isaac et al. (2017), Kurniawati et al. (2021), Yi et al. (2016), and Shahreki and Nakanishi (2016). Information systems that are suitable for completing tasks at work, with the support of employees' abilities to use them, cause the task processing time to be faster.

The results of the H6 study indicate that user satisfaction does not mediate the effect of the use of information technology on the performance of Kimia Farma's employees. The results of this study contradict the results of Isaac et al. (2017), Gatara and Cohen (2014), and Gu and Wang (2009). The results of the H7 study indicate that task-technology fit does not mediate the effect of the use of information technology on the performance of Kimia Farma's employees. The results of this study contradict the results of Isaac et al. (2017) and Robertson & Kee (2017). In H6 and H7, it shows that the influence of the use of information technology on employee

performance is a direct influence and not through mediation. This is because information technology, besides being used to help complete work, is also used to communicate with fellow employees and read various information about work. This will improve employees' ability to complete tasks.

Conclusion

The use of information technology by Kimia Farma employees has an effect on user satisfaction. The use of information technology by Kimia Farma employees has an effect on task-technology fit. The use of information technology by Kimia Farma employees has an effect on employee performance. User satisfaction has no effect on the performance of Kimia Farma employees in the Yogyakarta region. Task-technology fit affects the performance of Kimia Farma employees in the Yogyakarta area. User satisfaction does not mediate the effect of the use of information technology on the performance of Kimia Farma employees in the Yogyakarta area. Task-technology fit does not mediate the effect of the use of information technology on the performance of Kimia Farma employees in the Yogyakarta region.

The results of this research have practical implications as input for the management of PT Kimia Farma Apotek in making efforts to improve employee performance. Companies must be able to develop even better systems so that they can assist employees in carrying out work tasks so that they can be used properly by employees.

For the management of PT Kimia Farma Apotek Yogyakarta Business Unit, it should be able to carry out information technology development on the company's system on a regular basis to be able to improve performance when using the appropriate system. For further research, it is hoped that it can replace or add other variables that are in accordance with this research, especially on the satisfaction variable because this variable does not affect employee performance, so that research can be maximized.

The limitations of this research only focus on PT Kimia Farma Apotek employees who work for 1 year and use information technology such as the use of computers and software, devices and systems used by companies such as pos.kimiafarma.co.id & smartstock.kimiafarma.co.id which are located in the Yogyakarta business unit area.
